Assistant Professor

NFSU, Gandhinagar

Encryption

- Why Encryption
 - To achieve Confidentiality
 - Protection against unauthorized disclosure of information.
- What is Encryption?
- Types

Encryption

- can characterize Encryption system by:
 - ❖ type of encryption operations used
 - Substitution (each element of PT is mapped into another element)
 - Transposition (elements in PT are rearranged)
 - Product (combination of both)
 - ❖ number of keys used
 - single-key or private or symmetric
 - two-key or public or asymmetric
 - ❖ way in which plaintext is processed
 - block
 - stream

Some Basic Terminology

❑ **plaintext** - original message

❑ **ciphertext** - coded message

❑ **cipher** - algorithm for transforming plaintext to ciphertext

❑ **key** - info used in cipher known only to sender/receiver

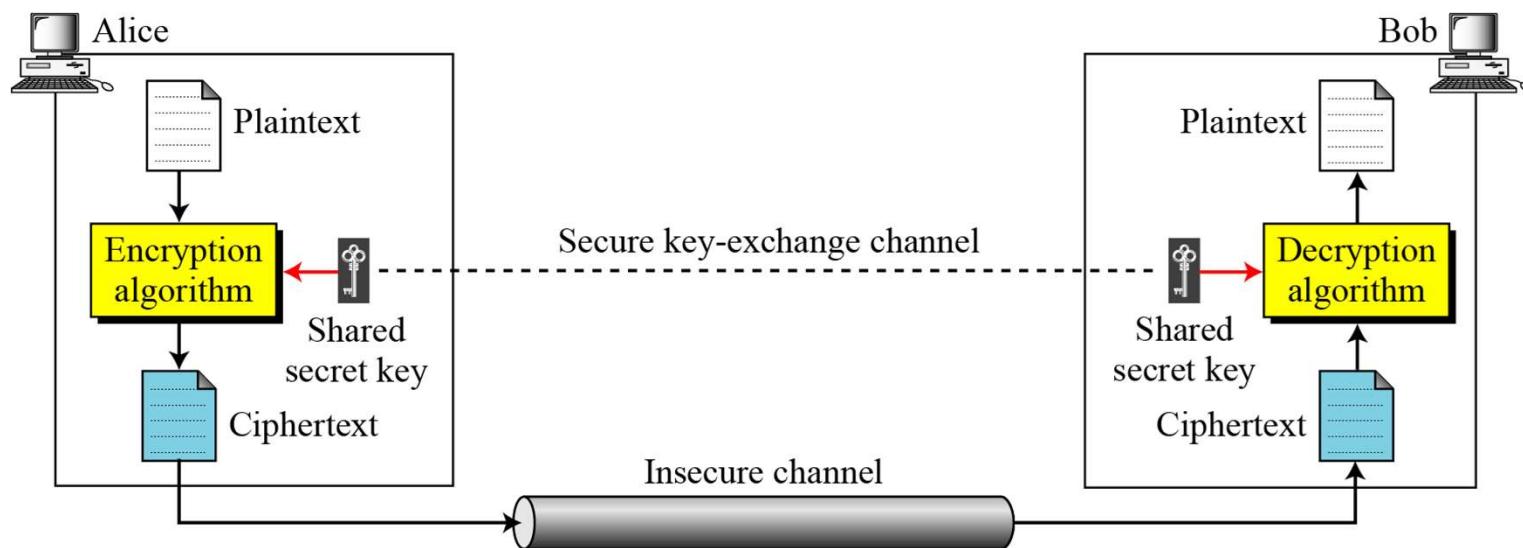

❑ **encipher (encrypt)** - converting plaintext to ciphertext

❑ **decipher (decrypt)** - recovering ciphertext from plaintext

❑ **cryptography** - study of encryption principles/methods

❑ **cryptanalysis (codebreaking)** - study of principles/ methods of deciphering ciphertext *without* knowing key

symmetric-key cipher

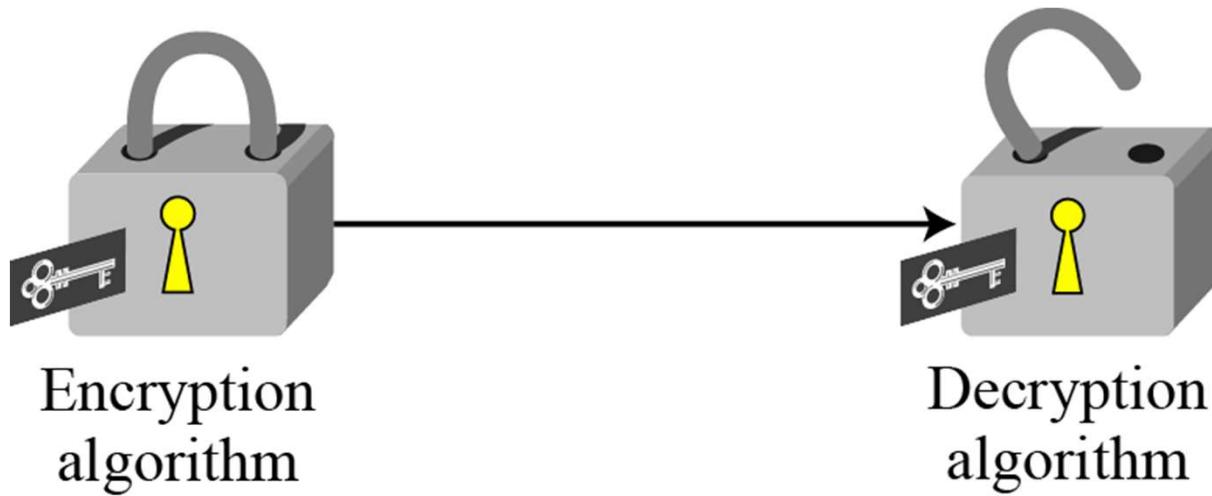

If P is the plaintext, C is the ciphertext, and K is the key,

Encryption: $C = E_k(P)$

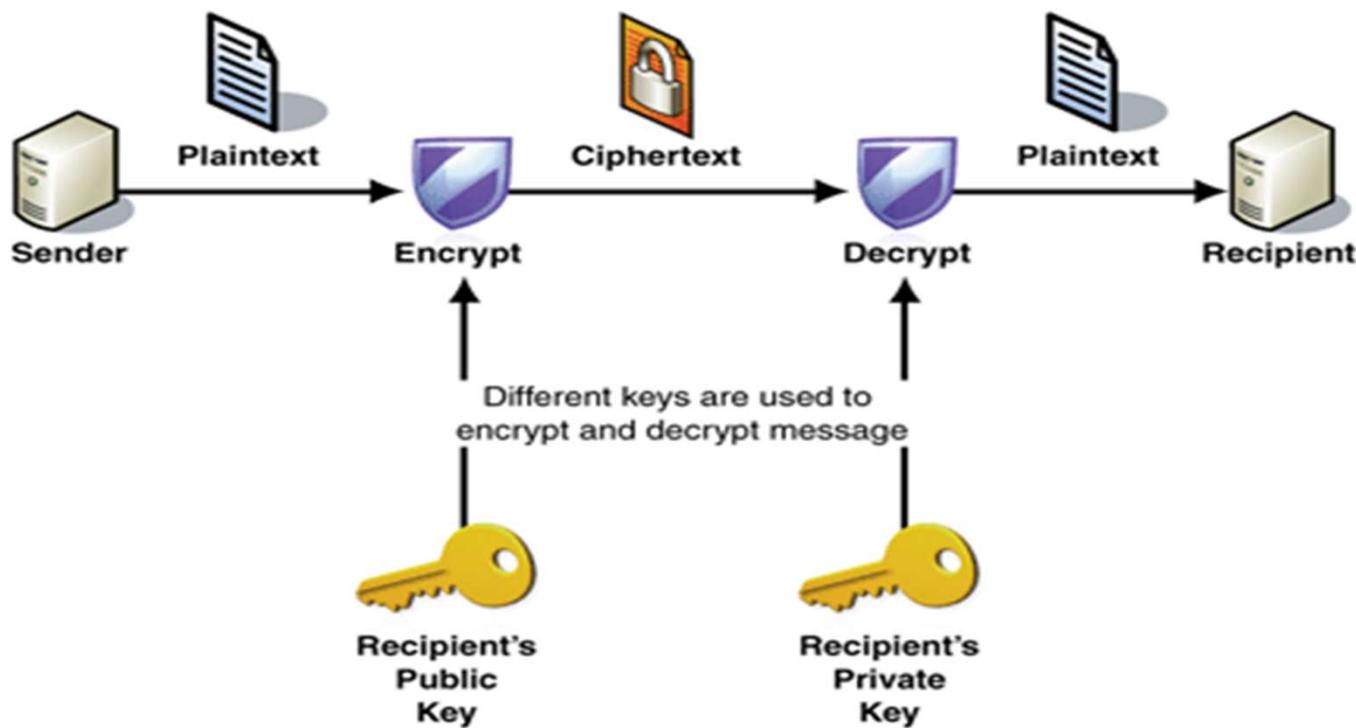

Decryption: $P = D_k(C)$

In which, $D_k(E_k(x)) = E_k(D_k(x)) = x$

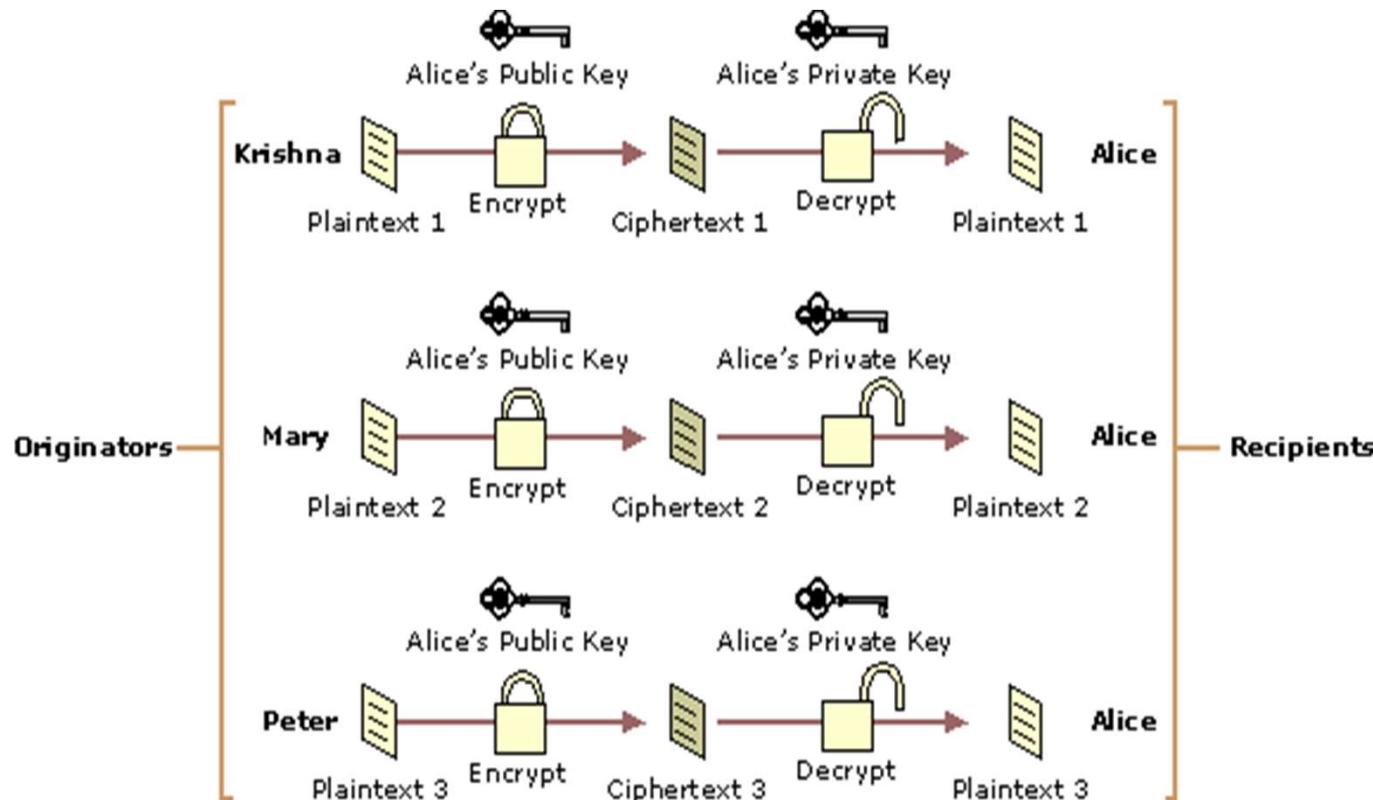

Locking and unlocking
with the same key

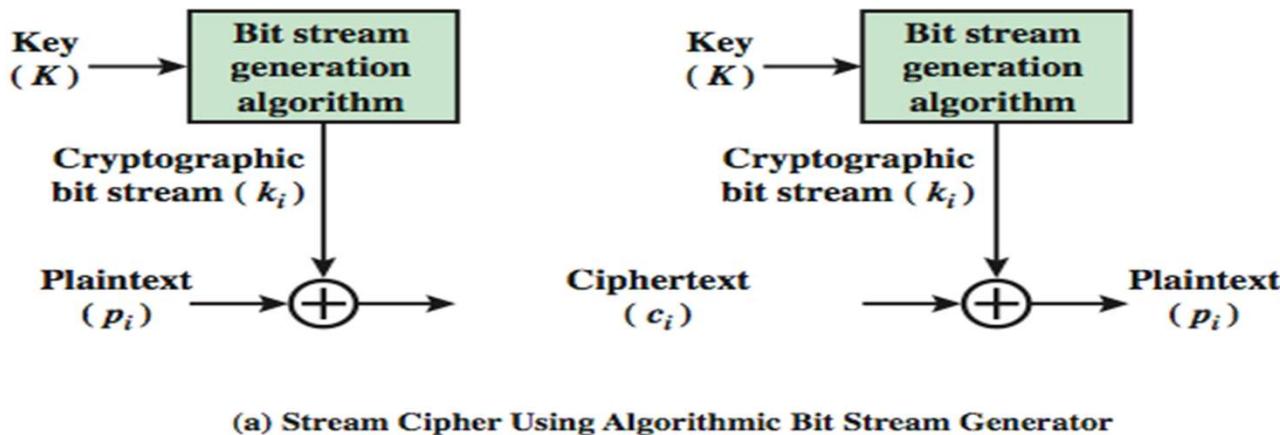

Asymmetric-key Cipher

Asymmetric-key Cipher

Block Vs Stream Ciphers

Block vs Stream Ciphers

- block ciphers process messages in blocks, each of which is then en/decrypted
 - like a substitution on very big characters
 - 64-bits or more
- stream ciphers process messages a bit or byte at a time when en/decrypting
- many current ciphers are block ciphers
 - broader range of applications

Stream Ciphers

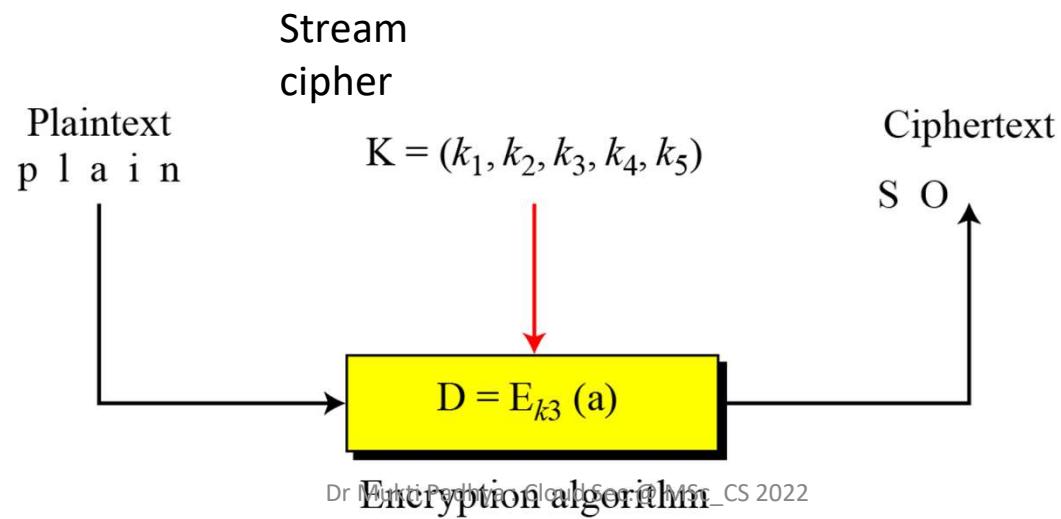

Call the plaintext stream P, the ciphertext stream C, and the key stream K.

$$P = P_1 P_2 P_3, \dots$$

$$C = C_1 C_2 C_3, \dots$$

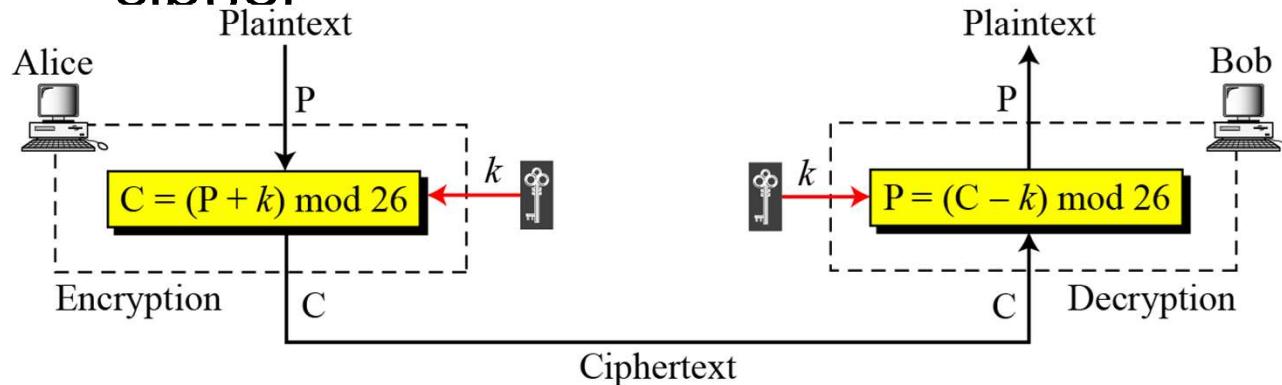

$$\mathbf{K} = (k_1, k_2, k_3, \dots)$$

$$C_1 = E_{k1}(P_1) \quad C_2 = E_{k2}(P_2) \quad C_3 = E_{k3}(P_3) \dots$$

- 
- Additive ciphers can be categorized as stream ciphers in which the key stream is the repeated value of the key. In other words, the key stream is considered as a predetermined stream of keys or $K = (k, k, \dots, k)$.
 - The monoalphabetic substitution ciphers are also stream ciphers.
 - However, each value of the key stream in this case is the mapping of the current plaintext character to the corresponding ciphertext character in the mapping table.

Continued Additive cipher

The simplest monoalphabetic cipher is the additive cipher. This cipher is sometimes called a **shift cipher** and sometimes a **Caesar cipher**, but the term additive cipher better reveals its mathematical nature.

When the cipher is additive, the plaintext, ciphertext, and key are integers in \mathbb{Z}_{26} .

Continued

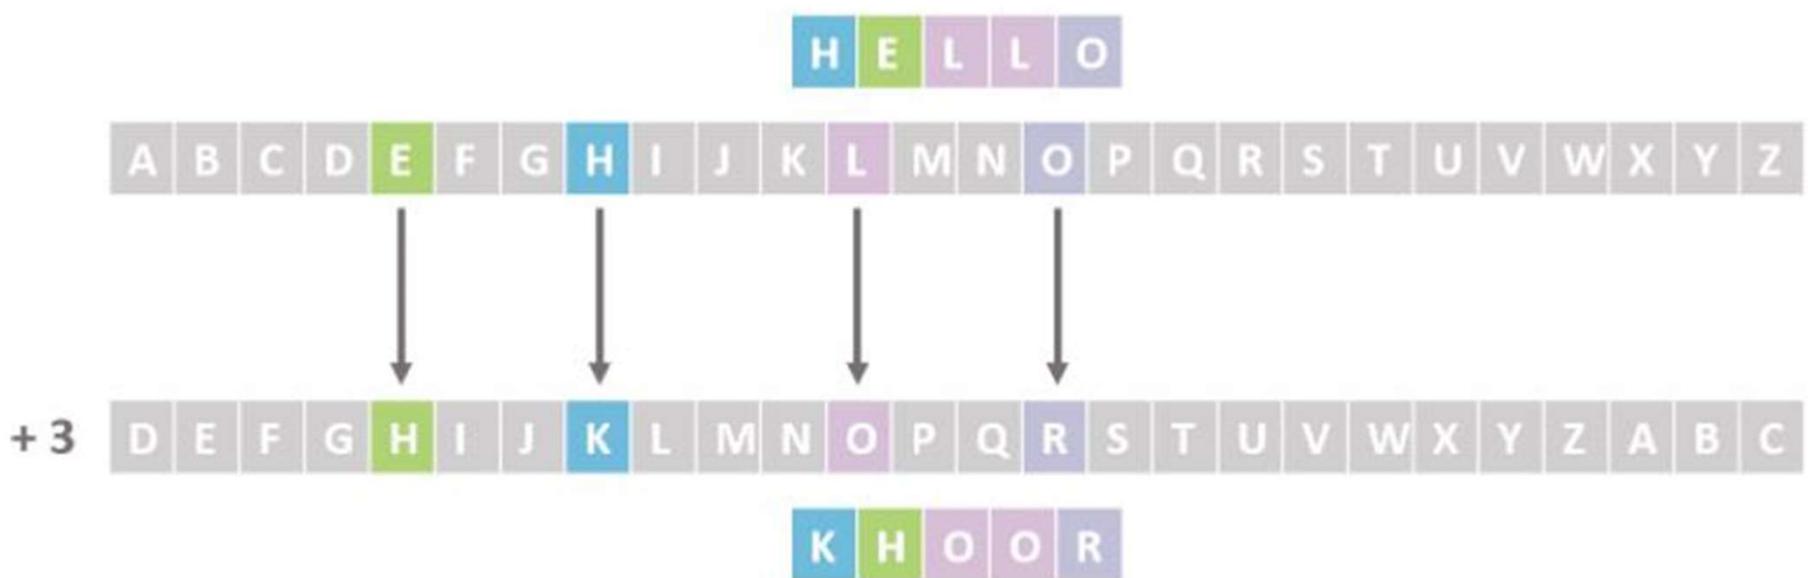

Use the additive cipher with key = 15 to encrypt the message “hello”.

a-0, b-1,c-2.....,z-25

Solution

We apply the encryption algorithm to the plaintext, character by character:

Plaintext: h → 07	Encryption: $(07 + 15) \text{ mod } 26$	Ciphertext: $22 \rightarrow W$
Plaintext: e → 04	Encryption: $(04 + 15) \text{ mod } 26$	Ciphertext: $19 \rightarrow T$
Plaintext: l → 11	Encryption: $(11 + 15) \text{ mod } 26$	Ciphertext: $00 \rightarrow A$
Plaintext: l → 11	Encryption: $(11 + 15) \text{ mod } 26$	Ciphertext: $00 \rightarrow A$
Plaintext: o → 14	Encryption: $(14 + 15) \text{ mod } 26$	Ciphertext: $03 \rightarrow D$

- mathematically give each letter a number

a	b	c	d	e	f	g	h	i	j	k	l	m	n	o	p	q	r	s	t	u	v	w	x	y	z
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25

- then have Caesar cipher as:

$$c = E(p) = (p + k) \bmod (26)$$

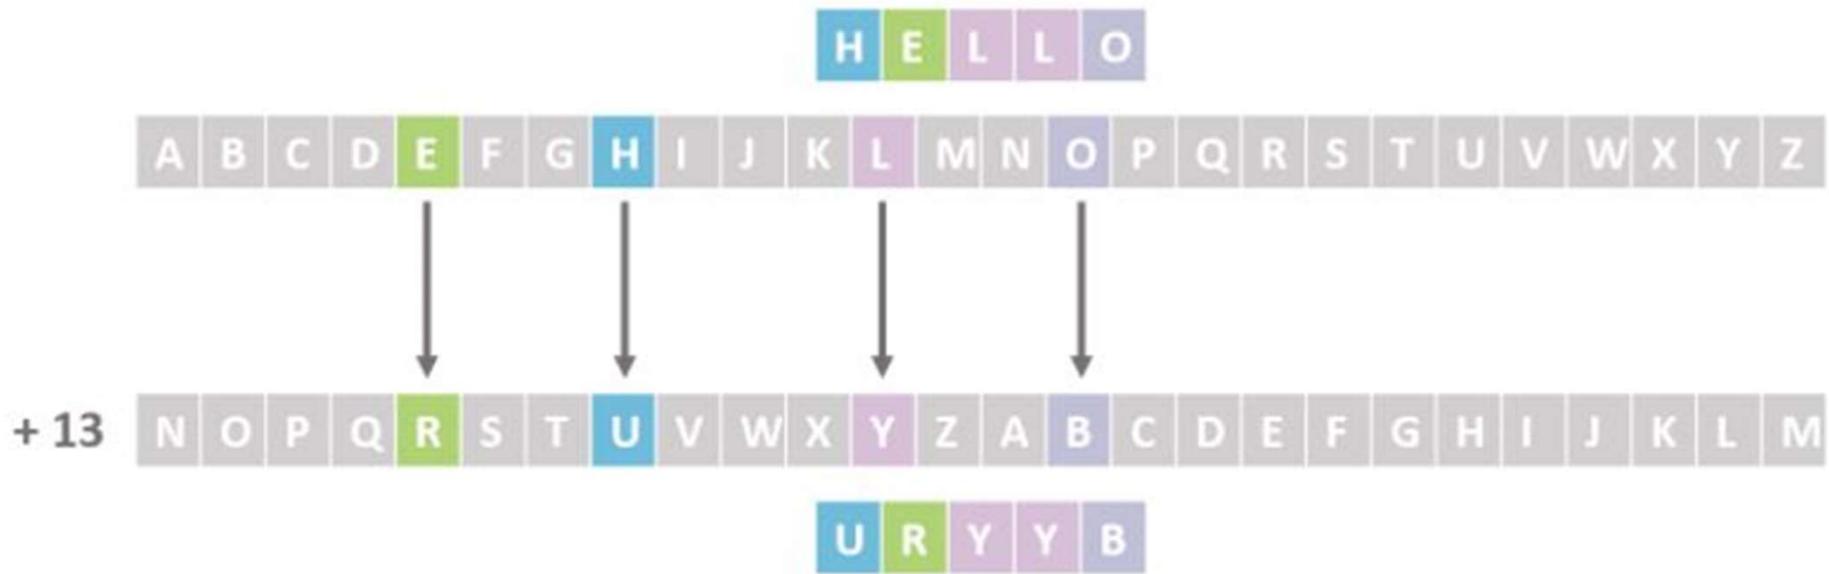

$$p = D(c) = (c - k) \bmod (26)$$

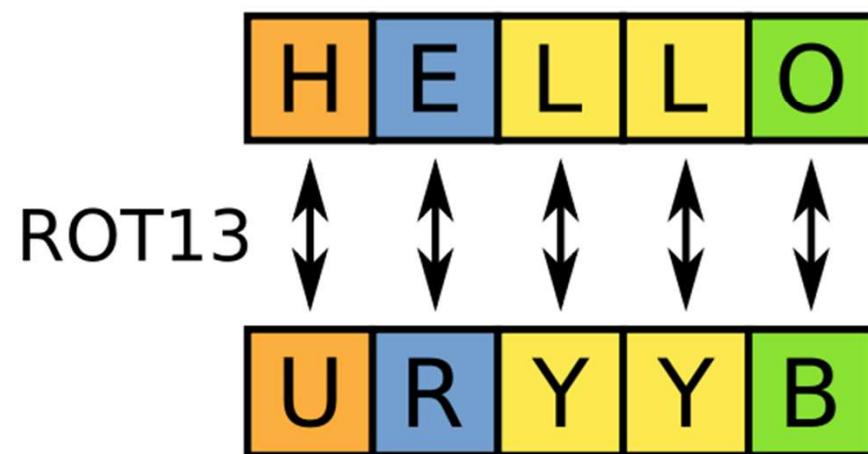

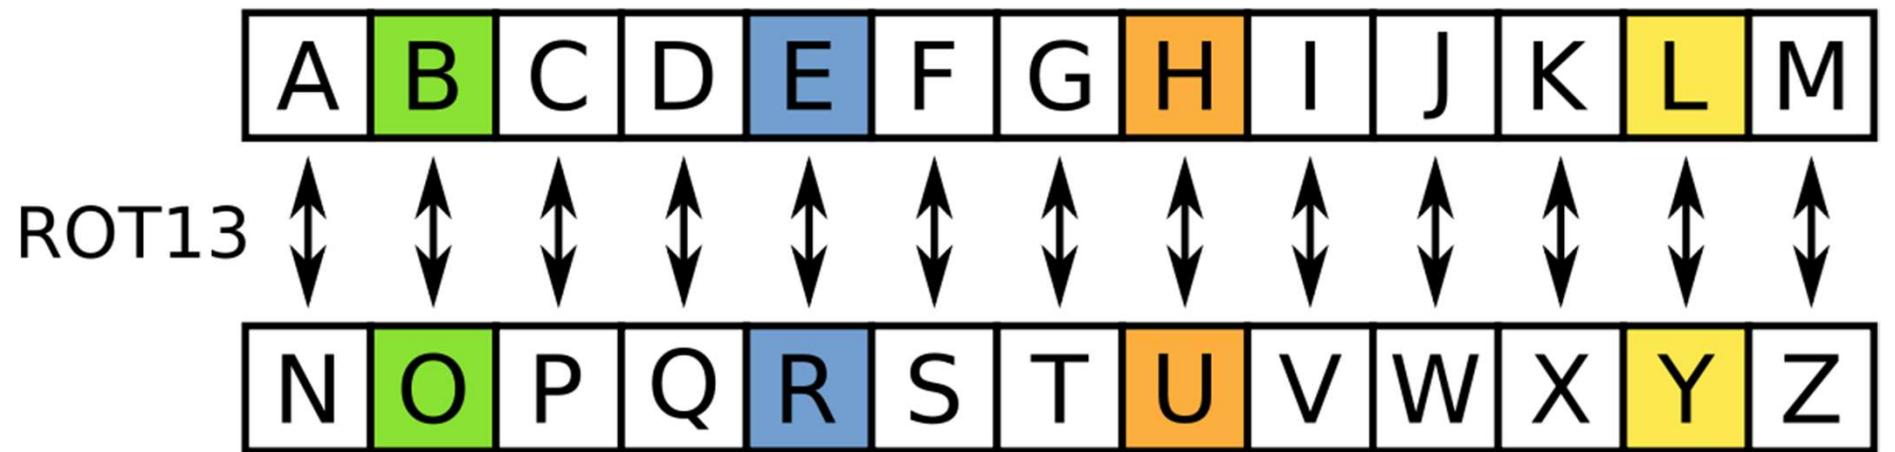

Plaintext : HELLO Key =13 Ciphertext : ?

Note: mod operation → $x \bmod n$ then if $x > n$ and n can divide x so output of mod is ZERO

If $x < n$ then output will be x itself

If x is negative then output will be $x+n$

Conti

nued Monoalphabetic

Substitution Cipher

- Because additive, multiplicative, and affine ciphers have small key domains, they are very vulnerable to brute-force attack.
- A better solution is to create a mapping between each plaintext character and the corresponding ciphertext character. Alice and Bob can agree on a table showing the mapping for each character.

An example key for
monoalphabetic substitution

Plaintext →	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o	p	q	r	s	t	u	v	w	x	y	z
Ciphertext →	N	O	A	T	R	B	E	C	F	U	X	D	Q	G	Y	L	K	H	V	I	J	M	P	Z	S	W

Continued

Example
encrypt the message

this message is easy to encrypt but hard to find the key

The ciphertext is

ICFVQRVVNEFVRNVSIYRGAHSLIOJICNHTIYBFGTICRXRS

Vigenere ciphers are also stream ciphers according to the definition.

In this case, the key stream is a repetition of m values, where m is the size of the keyword.

In other words,

$$K = (k_1, k_2, \dots, k_m, k_1, k_2, \dots, k_m, \dots)$$

Polyalphabet ic Ciphers

In polyalphabetic substitution, each occurrence of a character may have a different substitute. The relationship between a character in the plaintext to a character in the ciphertext is one-to-many.

Autokey

Cipher

$$P = P_1 P_2 P_3 \dots$$

$$C = C_1 C_2 C_3 \dots$$

$$k = (k_1, P_1, P_2, \dots)$$

$$\text{Encryption: } C_i = (P_i + k_i) \bmod 26$$

$$\text{Decryption: } P_i = (C_i - k_i) \bmod 26$$

Continued

Vigenere Cipher

$$P = P_1 P_2 P_3 \dots$$

$$C = C_1 C_2 C_3 \dots$$

$$K = [(k_1, k_2, \dots, k_m), (k_1, k_2, \dots, k_m), \dots]$$

$$\text{Encryption: } C_i = P_i + k_i$$

$$\text{Decryption: } P_i = C_i - k_i$$

Example

We can encrypt the message “She is listening” using the 6-character keyword “PASCAL”.

Conti

Ensued

mples

Let us see how we can encrypt the message “She is listening” using the 6-character keyword “PASCAL”. The initial key stream is (15, 0, 18, 2, 0, 11). The key stream is the repetition of this initial key stream (as many times as needed).

Plaintext:	s	h	e	i	s	l	i	s	t	e	n	i	n	g
P's values:	18	07	04	08	18	11	08	18	19	04	13	08	13	06
Key stream:	<i>15</i>	<i>00</i>	<i>18</i>	<i>02</i>	<i>00</i>	<i>11</i>	<i>15</i>	<i>00</i>	<i>18</i>	<i>02</i>	<i>00</i>	<i>11</i>	<i>15</i>	<i>00</i>
C's values:	07	07	22	10	18	22	23	18	11	6	13	19	02	06
Ciphertext:	H	H	W	K	S	W	X	S	L	G	N	T	C	G

Ciphertext : DATG

Key : 19

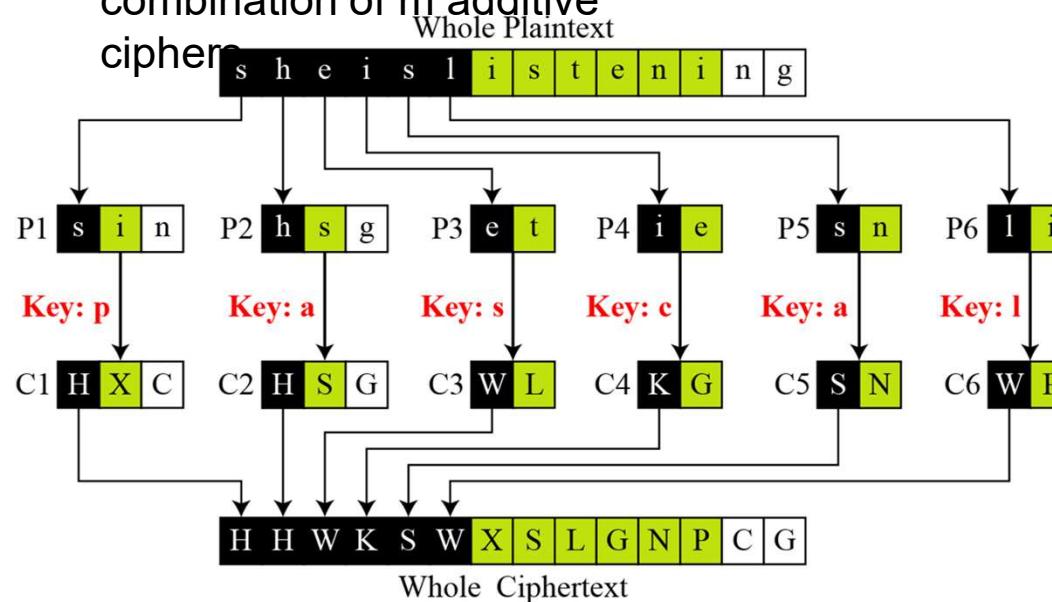

DECRYPTION

$$\begin{array}{r} \text{D} \quad \text{A} \quad \text{T} \quad \text{G} \\ 3 \quad 0 \quad 19 \quad 6 \\ - \quad 19 \quad 19 \quad 19 \quad 19 \\ \hline (\quad -16 \quad -19 \quad 0 \quad -13 \quad) \text{ mod } 26 \\ 10 \quad 7 \quad 0 \quad 13 \\ \hline \text{K} \quad \text{H} \quad \text{A} \quad \text{N} \end{array}$$

Continued Example

Vigenere cipher can be seen as combinations of m additive ciphers.

A Vigenere cipher as a combination of m additive ciphers

Block Ciphers

- In a block cipher, a group of plaintext symbols of size m ($m > 1$) are encrypted together creating a group of ciphertext of the same size.
- A single key is used to encrypt the whole block even if the key is made of multiple values.

- Playfair ciphers are block ciphers. The size of the block is $m = 2$. Two characters are encrypted together.
- Hill ciphers are block ciphers. A block of plaintext, of size 2 or more is encrypted together using a single key (a matrix).
- Although the key is made of $m \times m$ values, it is considered as a single key.

Playfair Cipher

- not even the large number of keys in a monoalphabetic cipher provides security
- one approach to improving security was to encrypt multiple letters
- the **Playfair Cipher** is an example
- invented by Charles Wheatstone in 1854, but named after his friend Baron Playfair

Playfair Key Matrix

- a 5X5 matrix of letters based on a keyword
- fill in letters of keyword (without duplicates)
- fill rest of matrix with other letters
- eg. using the keyword MONARCHY

M	O	N	A	R
C	H	Y	B	D
E	F	G	I/J	K
L	P	Q	S	T
U	V	W	X	Z

Encrypting and Decrypting

plaintext is encrypted two letters at a time

- if a pair is a repeated letter, insert filler like 'X'
- ABC AB CX

*	*	*	*	*	*
*	O	Y	R	Z	
*	*	*	*	*	
*	*	*	*	*	
*	*	*	*	*	

*	*	O	*	*
*	*	B	*	*
*	*	*	*	*
*	*	R	*	*
*	*	Y	*	*

Hence, OR -> BY

Hence, OR -> YZ

Z	*	*	O	*
*	*	*	*	*
*	*	*	*	*
R	*	*	X	*
*	*	*	*	*

Hence, OR ->
ZX

Hill Cipher

Key in the Hill cipher

$$\mathbf{K} = \begin{bmatrix} k_{11} & k_{12} & \dots & k_{1m} \\ k_{21} & k_{22} & \dots & k_{2m} \\ \vdots & \vdots & & \vdots \\ k_{m1} & k_{m2} & \dots & k_{mm} \end{bmatrix}$$

$$\begin{aligned} C_1 &= P_1 k_{11} + P_2 k_{21} + \dots + P_m k_{m1} \\ C_2 &= P_1 k_{12} + P_2 k_{22} + \dots + P_m k_{m2} \\ &\dots \\ C_m &= P_1 k_{1m} + P_2 k_{2m} + \dots + P_m k_{mm} \end{aligned}$$

The key matrix in the Hill cipher needs to have a multiplicative inverse.

Continu

Examp le

For example, the plaintext “code is ready” can make a 3×4 matrix when adding extra bogus character “z” to the last block and removing the spaces. The ciphertext is “OHKNIHGKLSS”.

$$\begin{bmatrix} 14 & 07 & 10 & 13 \\ 08 & 07 & 06 & 11 \\ 11 & 08 & 18 & 18 \end{bmatrix}^C = \begin{bmatrix} 02 & 14 & 03 & 04 \\ 08 & 18 & 17 & 04 \\ 00 & 03 & 24 & 25 \end{bmatrix}^P \begin{bmatrix} 09 & 07 & 11 & 13 \\ 04 & 07 & 05 & 06 \\ 02 & 21 & 14 & 09 \\ 03 & 23 & 21 & 08 \end{bmatrix}^K$$

a. Encryption

$$\begin{bmatrix} 02 & 14 & 03 & 04 \\ 08 & 18 & 17 & 04 \\ 00 & 03 & 24 & 25 \end{bmatrix}^P = \begin{bmatrix} 14 & 07 & 10 & 13 \\ 08 & 07 & 06 & 11 \\ 11 & 08 & 18 & 18 \end{bmatrix}^C \begin{bmatrix} 02 & 15 & 22 & 03 \\ 15 & 00 & 19 & 03 \\ 09 & 09 & 03 & 11 \\ 17 & 00 & 04 & 07 \end{bmatrix}^{K^{-1}}$$

b. Decryption

Example:

Message: “ pay more money”

PAY 15 0 24

Key : 17 17 5
21 18 21
2 2 19

15
0
24

$$P.T = \begin{bmatrix} p & m & e & n \\ a & o & m & e \\ y & r & o & y \end{bmatrix} = \begin{bmatrix} 15 & 12 & 4 & 13 \\ 0 & 14 & 12 & 4 \\ 24 & 17 & 14 & 24 \end{bmatrix}$$

$$P.T_1 = \begin{bmatrix} p \\ a \\ y \end{bmatrix} = \begin{bmatrix} 15 \\ 0 \\ 24 \end{bmatrix}$$

$$C.T_1 = Key \times P.T_1 \bmod 26 = \begin{bmatrix} 17 & 17 & 5 \\ 21 & 18 & 21 \\ 2 & 2 & 19 \end{bmatrix} \begin{bmatrix} 15 \\ 0 \\ 24 \end{bmatrix} \bmod 26 = \begin{bmatrix} 11 \\ 13 \\ 18 \end{bmatrix} = \begin{bmatrix} L \\ N \\ S \end{bmatrix}$$

$$C.T_2 = Key \times P.T_2 \bmod 26 = \begin{bmatrix} 17 & 17 & 5 \\ 21 & 18 & 21 \\ 2 & 2 & 19 \end{bmatrix} \begin{bmatrix} 12 \\ 14 \\ 17 \end{bmatrix} \bmod 26 = \begin{bmatrix} 7 \\ 3 \\ 11 \end{bmatrix} = \begin{bmatrix} H \\ D \\ L \end{bmatrix}$$

► And so on... then the C.T = **LNS HDL.....**

Example

② Ciphertext : WIIT

② Key: 3 7
 1 5

Message: ?

HELP

Inverse : 2 x 2 Matrix

$$\begin{bmatrix} 4 & 7 \\ 2 & 6 \end{bmatrix}^{-1} = \frac{1}{4 \times 6 - 7 \times 2} \begin{bmatrix} 6 & -7 \\ -2 & 4 \end{bmatrix}$$
$$= \frac{1}{10} \begin{bmatrix} 6 & -7 \\ -2 & 4 \end{bmatrix}$$
$$= \begin{bmatrix} 0.6 & -0.7 \\ -0.2 & 0.4 \end{bmatrix}$$

Continu

Examp le

Assume that Eve knows that $m = 3$. She has intercepted three plaintext/ciphertext pair blocks (not necessarily from the same message)

$$\begin{bmatrix} 05 & 07 & 10 \end{bmatrix} \longleftrightarrow \begin{bmatrix} 03 & 06 & 00 \end{bmatrix}$$

$$\begin{bmatrix} 13 & 17 & 07 \end{bmatrix} \longleftrightarrow \begin{bmatrix} 14 & 16 & 09 \end{bmatrix}$$

$$\begin{bmatrix} 00 & 05 & 04 \end{bmatrix} \longleftrightarrow \begin{bmatrix} 03 & 17 & 11 \end{bmatrix}$$

P

C

Example (Continued)

She makes matrices P and C from these pairs. Because P is invertible, she inverts the P matrix and multiplies it by C to get the K matrix

$$\begin{bmatrix} 02 & 03 & 07 \\ 05 & 07 & 09 \\ 01 & 02 & 11 \end{bmatrix} = \begin{bmatrix} 21 & 14 & 01 \\ 00 & 08 & 25 \\ 13 & 03 & 08 \end{bmatrix} \begin{bmatrix} 03 & 06 & 00 \\ 14 & 16 & 09 \\ 03 & 17 & 11 \end{bmatrix}$$

Now she has the key and can break any ciphertext encrypted with that key.

$$M = \begin{pmatrix} 1 & 2 & 3 \\ 0 & 1 & 4 \\ 5 & 6 & 0 \end{pmatrix} \quad M = \begin{pmatrix} 1 & 2 & 3 \\ 0 & 1 & 4 \\ 5 & 6 & 0 \end{pmatrix} \quad M = \begin{pmatrix} 1 & 2 & 3 \\ 0 & 1 & 4 \\ 5 & 6 & 0 \end{pmatrix}$$

\hookrightarrow ex. $|((1 \times 0) - (6 \times 4))|$

$$\det(M) = |(0 - 24) - 2(0 - 20) + 3(0 - 5)| \\ = 1$$

$$M^{-1} = \frac{1}{\det(M)} (\text{adj}(M)) \quad \det(M) = 1$$

$$\text{adj}(M) = \begin{pmatrix} -24 & 18 & 5 \\ 20 & -15 & -4 \\ -5 & 4 & 1 \end{pmatrix}$$

$M^{-1} = \frac{1}{1} \begin{pmatrix} -24 & 18 & 5 \\ 20 & -15 & -4 \\ -5 & 4 & 1 \end{pmatrix}$

$M^{-1} = \frac{1}{1} \begin{pmatrix} -24 & 18 & 5 \\ 20 & -15 & -4 \\ -5 & 4 & 1 \end{pmatrix}$

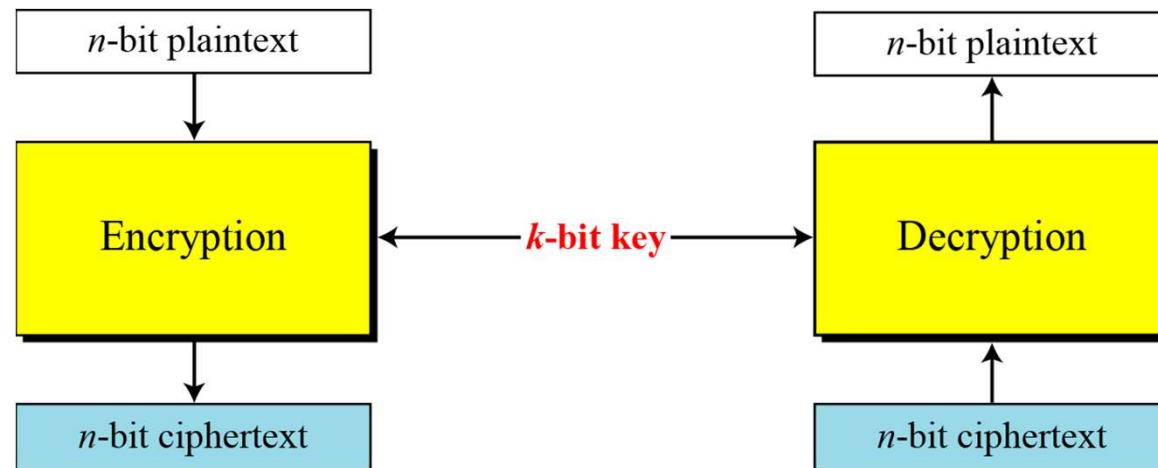

$$M^{-1} = \begin{pmatrix} -24 & 18 & 5 \\ 20 & -15 & -4 \\ -5 & 4 & 1 \end{pmatrix}$$

MODERN BLOCK CIPHERS

A symmetric-key modern block cipher encrypts an n-bit block of plaintext or decrypts an n-bit block of ciphertext.

The encryption or decryption algorithm uses a k-bit key.

A modern block cipher

Substitution or Transposition

A modern block cipher can be designed to act as a substitution cipher or a transposition cipher.

Fiestel Structure → 16 rounds

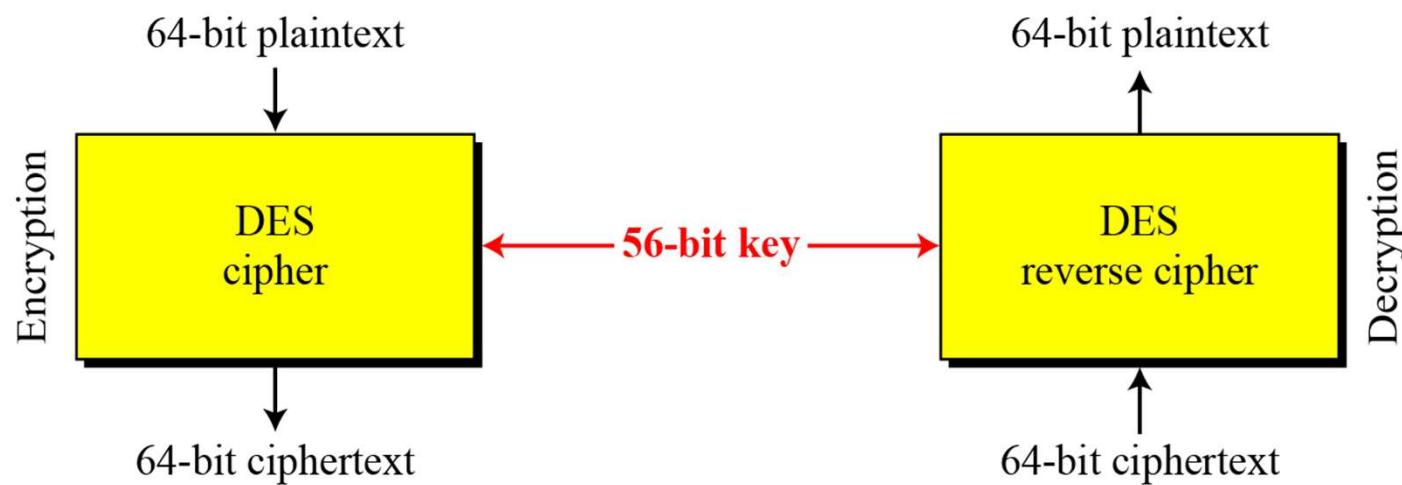

Example DES AES

To be resistant to exhaustive-search attack,
a modern block cipher needs to be
designed as a substitution cipher.

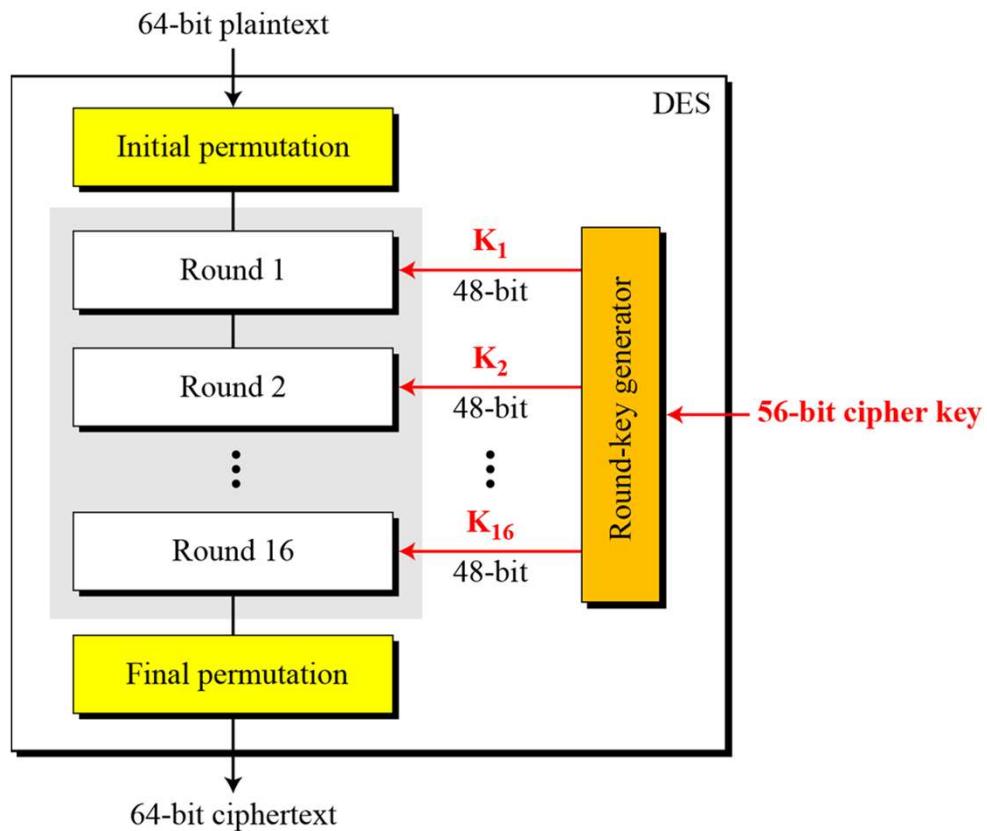

Encryption

- can characterize Encryption system by:
 - ❖ type of encryption operations used
 - Substitution (each element of PT is mapped into another element)
 - HELLO → AXMRW
 - Transposition (elements in PT are rearranged)
 - HELLO → LHLOE
 - Product (combination of both)
 - ❖ number of keys used
 - single-key or private or symmetric
 - two-key or public or asymmetric
 - ❖ way in which plaintext is processed
 - block
 - stream

Encryption and decryption with DES

DES STRUCTURE

Continue
d

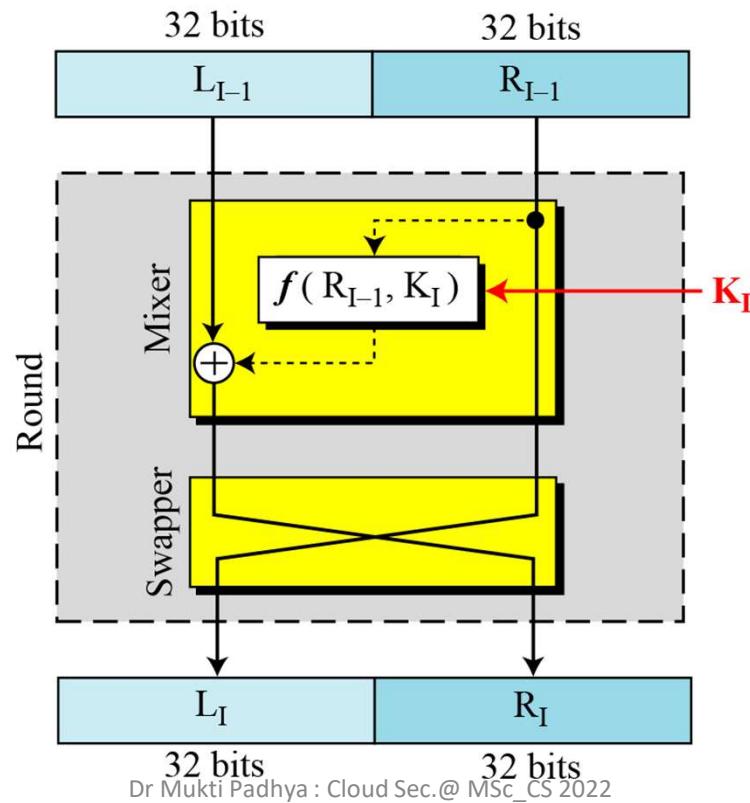

The initial and final permutations are straight P-boxes that
are inverses of each other.
They have no cryptography significance in DES.

Round

s

DES uses 16 rounds. Each round of DES is a Feistel cipher.

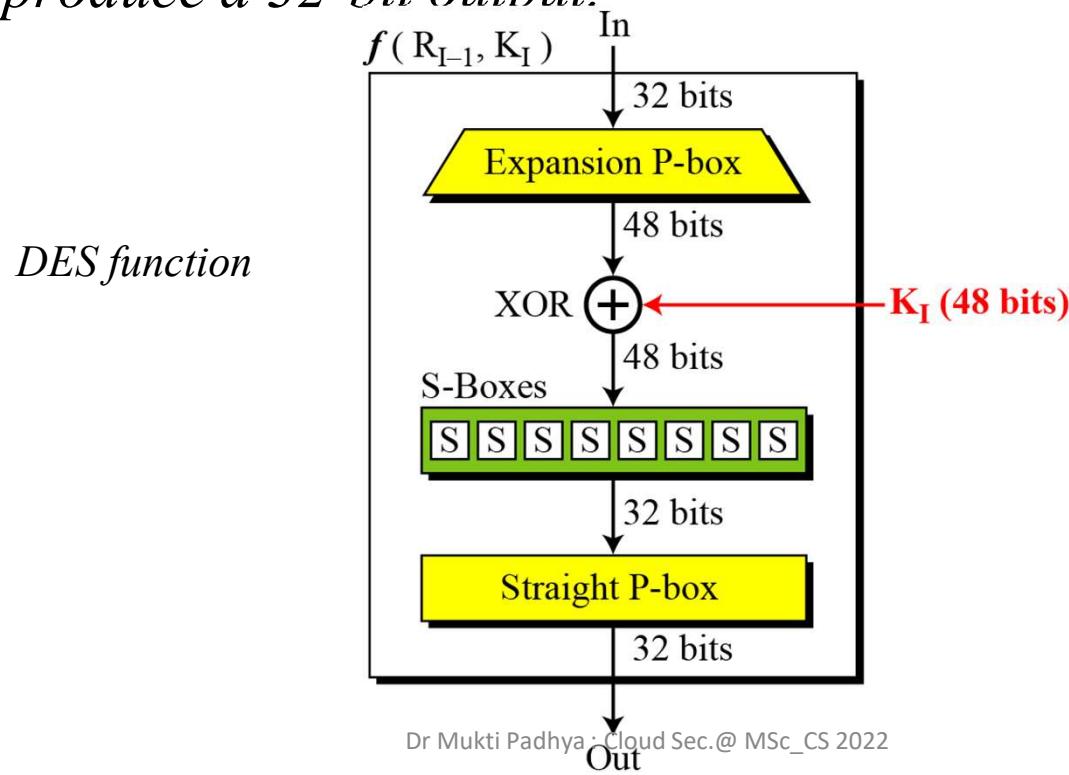

*A round in DES
(encryption site)*

Continued

DES Function

The heart of DES is the DES function. The DES function applies a 48-bit key to the rightmost 32 bits to produce a 32-bit output.

Asymmetric-Key Cryptography

Note

Symmetric-key cryptography is based on sharing secrecy;
asymmetric-key cryptography is based on personal secrecy.

Symmetric-Key Cryptography

- traditional **private/secret/single key** cryptography uses **one key**
- shared by both sender and receiver
- if this key is disclosed communications are compromised
- also is **symmetric**, parties are equal
- hence does not protect sender from receiver forging a message & claiming is sent by sender

Asymmetric-Key Cryptography

- probably most significant advance in the 3000 year history of cryptography
- uses **two** keys – a public & a private key
- **asymmetric** since parties are **not** equal
- uses clever application of number theoretic concepts to function
- complements **rather than** replaces private key crypto

Why Public-Key Cryptography?

- developed to address two key issues:
 - **key distribution** – how to have secure communications in general without having to trust a KDC with your key
 - **digital signatures** – how to verify a message comes intact from the claimed sender
- public invention due to Whitfield Diffie & Martin Hellman at Stanford University in 1976
 - known earlier in classified community

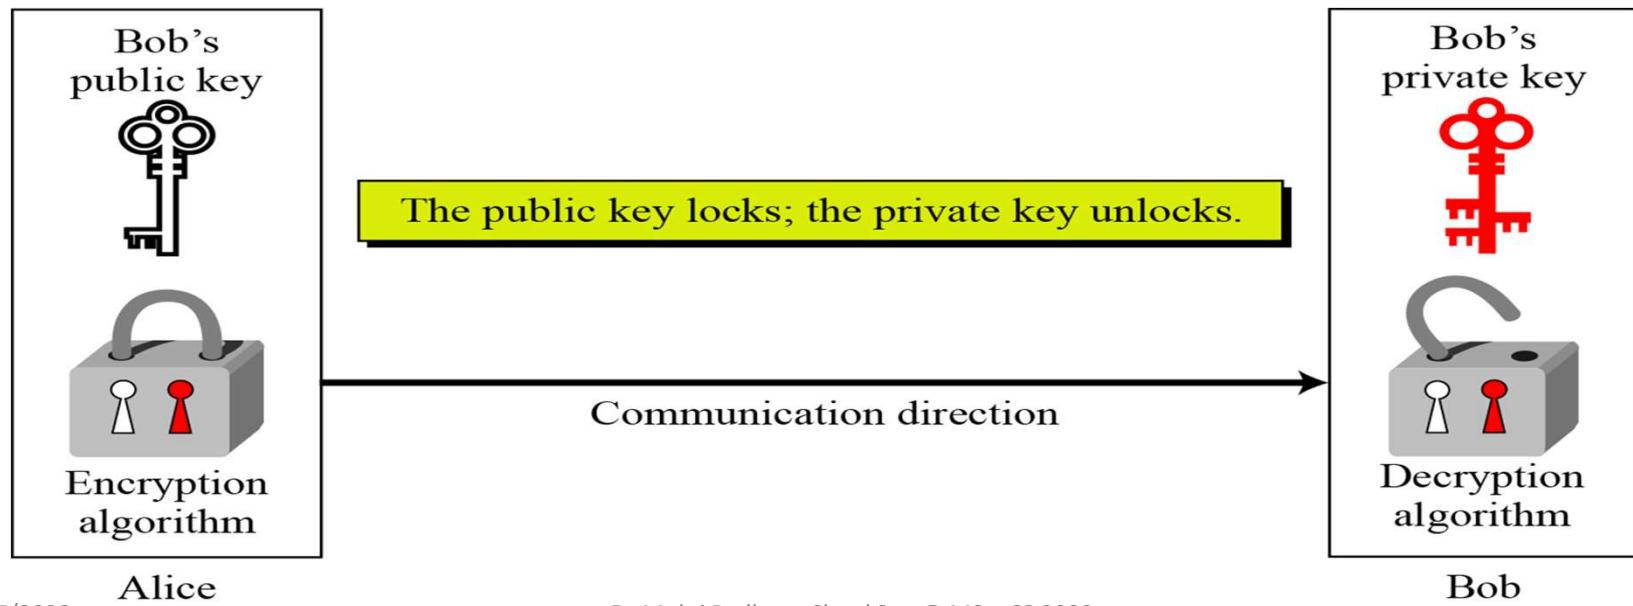

Public-Key Cryptography

- **public-key/two-key/asymmetric** cryptography involves the use of **two keys**:
 - a **public-key**, which may be known by anybody, and can be used to **encrypt messages**, and **verify signatures**
 - a related **private-key**, known only to the recipient, used to **decrypt messages**, and **sign** (create) **signatures**
- **infeasible to determine private key from public**
- **is asymmetric** because
 - those who encrypt messages or verify signatures **cannot** decrypt messages or create signatures

Keys

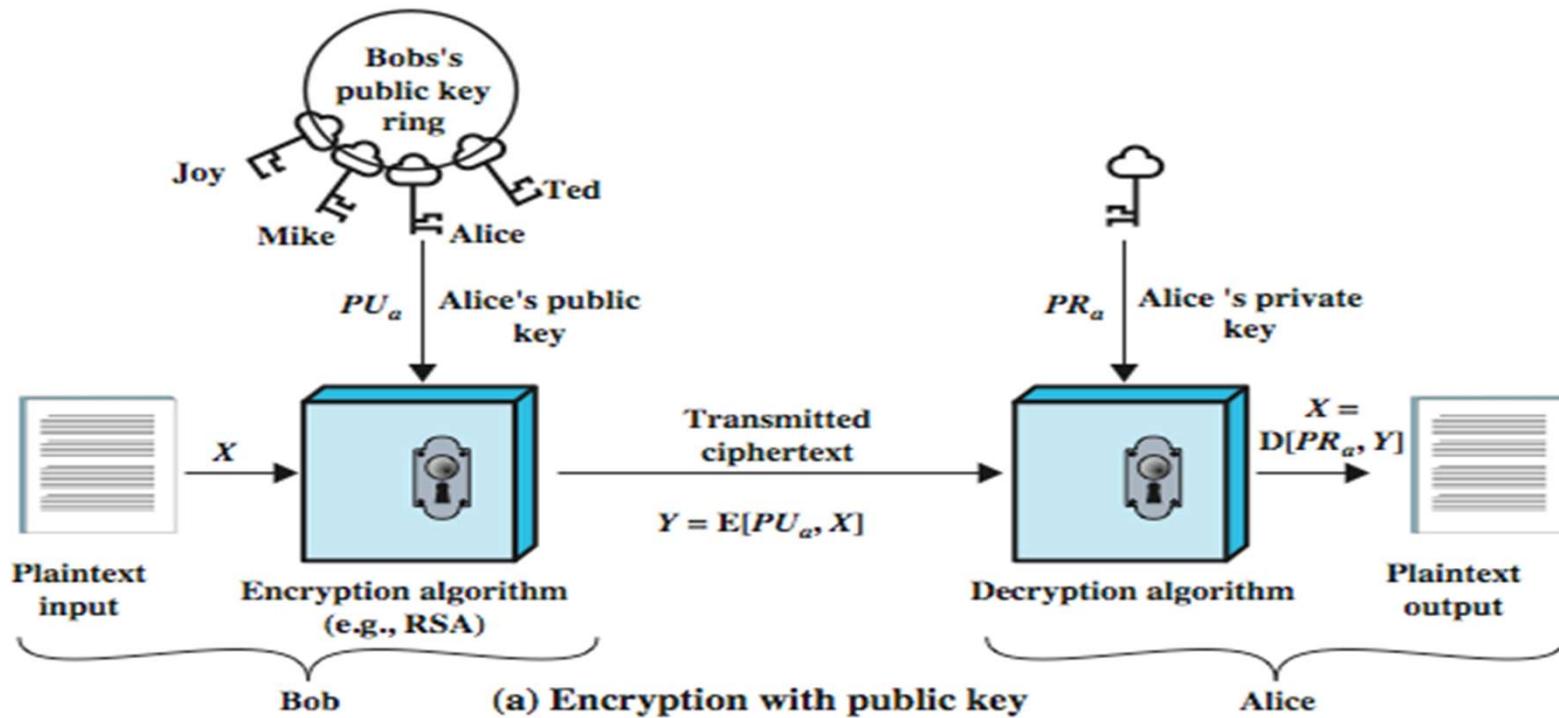

Asymmetric key cryptography uses two separate keys: one private and one public.

Locking and unlocking in asymmetric-key cryptosystem

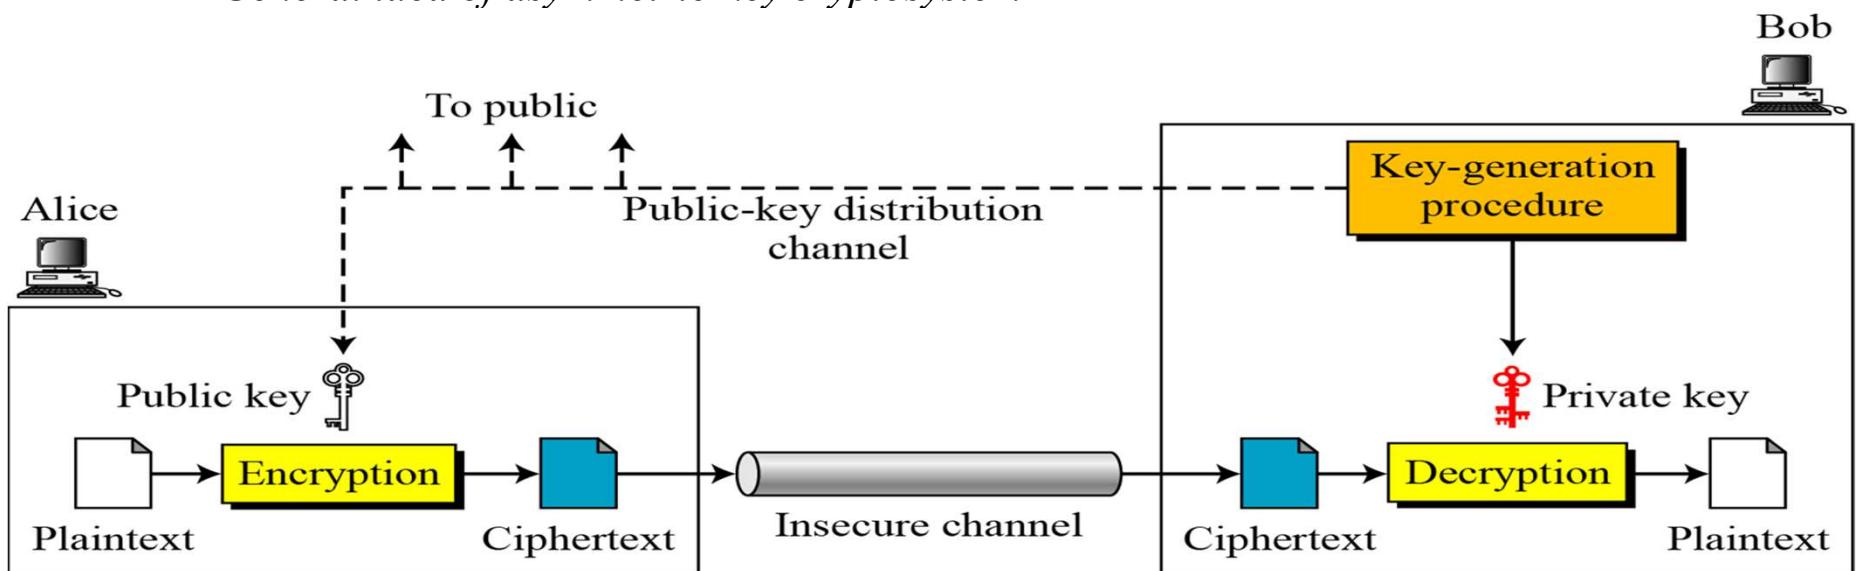

Asymmetric/Public-Key Cryptography

Many to one communication

General Idea

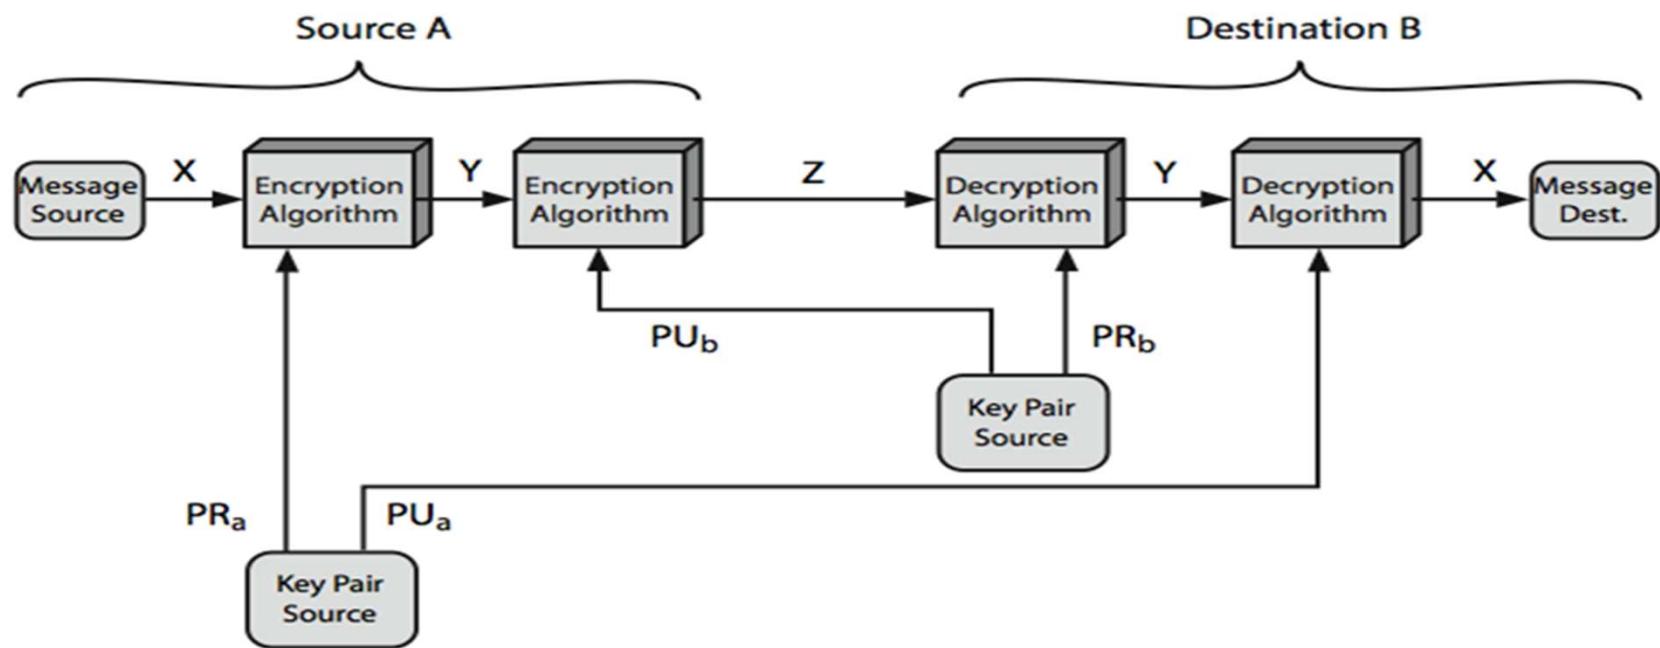

General idea of asymmetric-key cryptosystem

Symmetric vs Public-Key

Conventional Encryption	Public-Key Encryption
<p><i>Needed to Work:</i></p> <ol style="list-style-type: none">1. The same algorithm with the same key is used for encryption and decryption.2. The sender and receiver must share the algorithm and the key. <p><i>Needed for Security:</i></p> <ol style="list-style-type: none">1. The key must be kept secret.2. It must be impossible or at least impractical to decipher a message if no other information is available.3. Knowledge of the algorithm plus samples of ciphertext must be insufficient to determine the key.	<p><i>Needed to Work:</i></p> <ol style="list-style-type: none">1. One algorithm is used for encryption and decryption with a pair of keys, one for encryption and one for decryption.2. The sender and receiver must each have one of the matched pair of keys (not the same one). <p><i>Needed for Security:</i></p> <ol style="list-style-type: none">1. One of the two keys must be kept secret.2. It must be impossible or at least impractical to decipher a message if no other information is available.3. Knowledge of the algorithm plus one of the keys plus samples of ciphertext must be insufficient to determine the other key.

Public-Key Cryptosystems

Public-Key Applications

- can classify uses into 3 categories:
 - **encryption/decryption** (provide secrecy)
 - **digital signatures** (provide authentication)
 - **key exchange** (of session keys)
- some algorithms are suitable for all uses, others are specific to one

Algorithm	Encryption/Decryption	Digital Signature	Key Exchange
RSA	Yes	Yes	Yes
Elliptic Curve	Yes	Yes	Yes
Diffie-Hellman	No	No	Yes
DSS	No	Yes	No

Public-Key Requirements

- Public-Key algorithms rely on two keys where:
 - it is computationally infeasible to find decryption key knowing only algorithm & encryption key
 - it is computationally easy to en/decrypt messages when the relevant (en/decrypt) key is known
 - either of the two related keys can be used for encryption, with the other used for decryption (for some algorithms)
- these are formidable requirements which only a few algorithms have satisfied

Security of Public Key Schemes

- like private key schemes brute force **exhaustive search** attack is always theoretically possible
- but keys used are too large (>512bits)
- security relies on a **large enough** difference in difficulty between **easy** (en/decrypt) and **hard** (cryptanalyse) problems
- more generally the **hard** problem is known, but is made hard enough to be impractical to break
- requires the use of **very large numbers**
- hence is **slow** compared to private key schemes

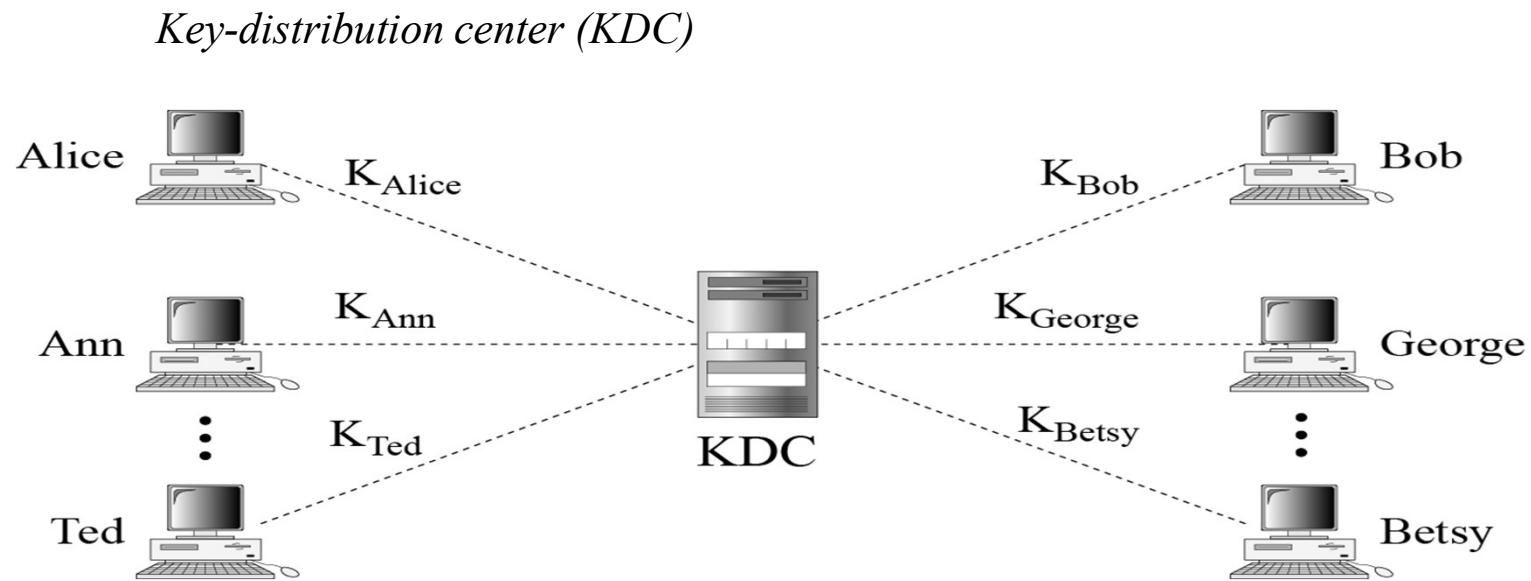

Symmetric-key Distribution

Symmetric-key cryptography is more efficient than asymmetric-key cryptography for enciphering large messages. Symmetric-key cryptography, however, needs a shared secret key between two parties. The distribution of keys is another problem.

Two Possible Ways:

- 1 Key-Distribution Center: KDC
- 2 Session Keys

Key-Distribution Center: KDC

Symmetric-key Agreement

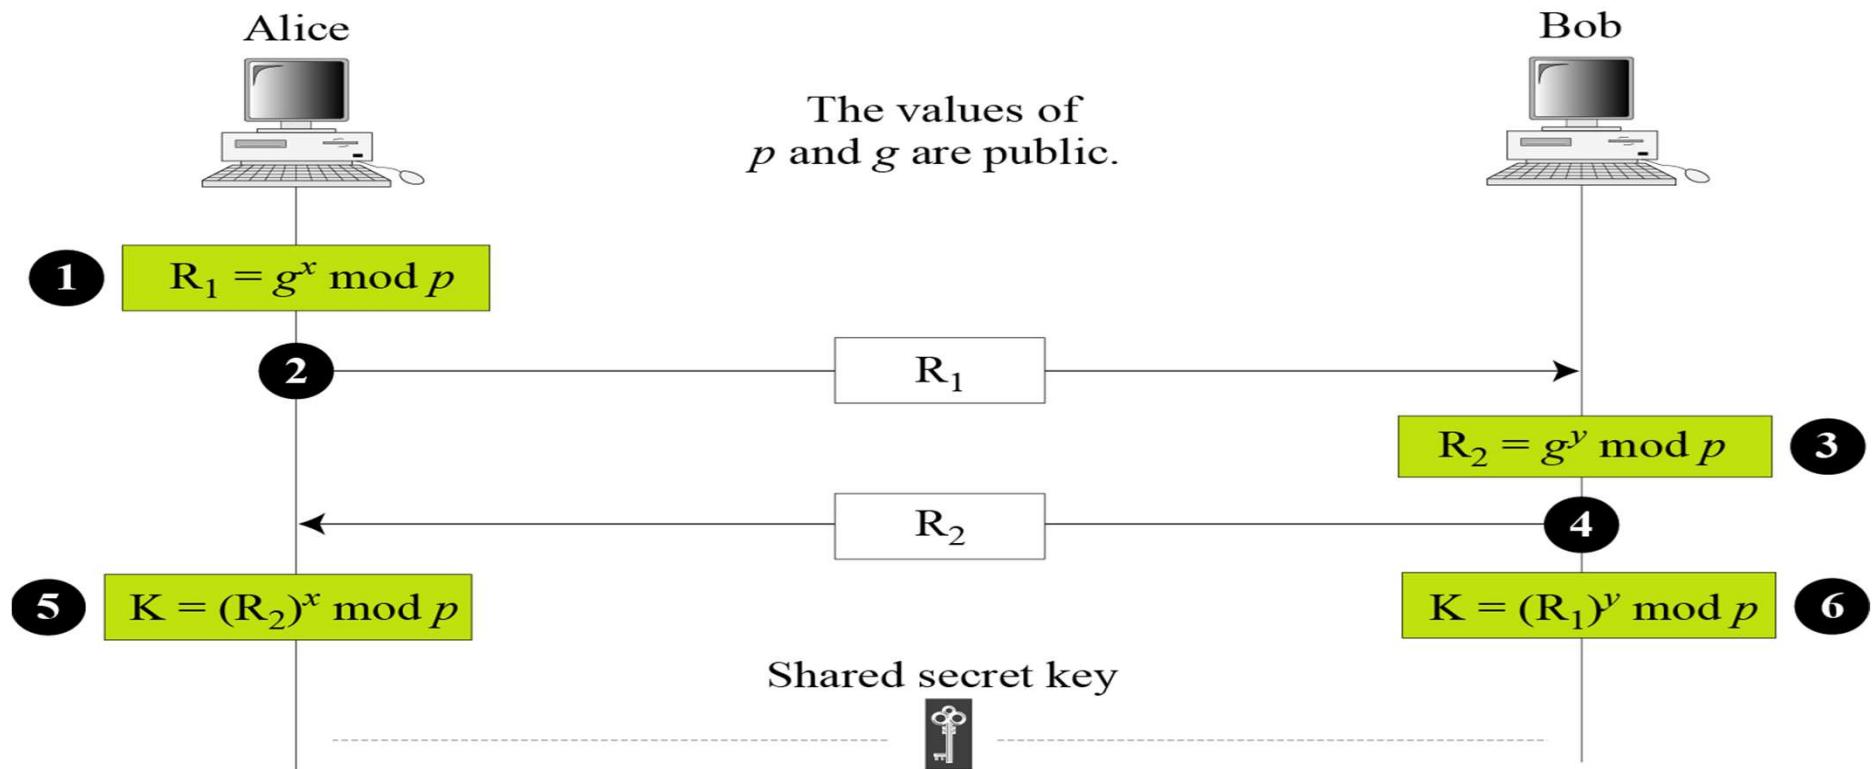

Alice and Bob can create a session key between themselves without using a KDC. This method of session-key creation is referred to as the symmetric-key agreement.

Techniques for Key

- 1 Diffie-Hellman ~~Agreement~~ Key Agreement
- 2 Station-to-Station Key Agreement

Diffie-Hellman Key Agreement

Diffie-Hellman method

$$K = g^{xy} \text{ mod } p$$

Note

The symmetric (shared) key in the Diffie-Hellman method is
 $K = g^{xy} \text{ mod } p.$

Example

Let us give a trivial example to make the procedure clear. Our example uses small numbers, but note that in a real situation, the numbers are very large. Assume that $g = 7$ and $p = 23$. The steps are as follows:

1. Alice chooses $x = 3$ and calculates $R_1 = 7^3 \bmod 23 = 21$.
2. Bob chooses $y = 6$ and calculates $R_2 = 7^6 \bmod 23 = 4$.
3. Alice sends the number 21 to Bob.
4. Bob sends the number 4 to Alice.
5. Alice calculates the symmetric key $K = 4^3 \bmod 23 = 18$.
6. Bob calculates the symmetric key $K = 21^6 \bmod 23 = 18$.
7. The value of K is the same for both Alice and Bob;
 $g^{xy} \bmod p = 7^{18} \bmod 35 = 18$.

Example

Let us give a more realistic example. We used a program to create a random integer of 512 bits (the ideal is 1024 bits). The integer p is a 159-digit number. We also choose g , x , and y as shown below:

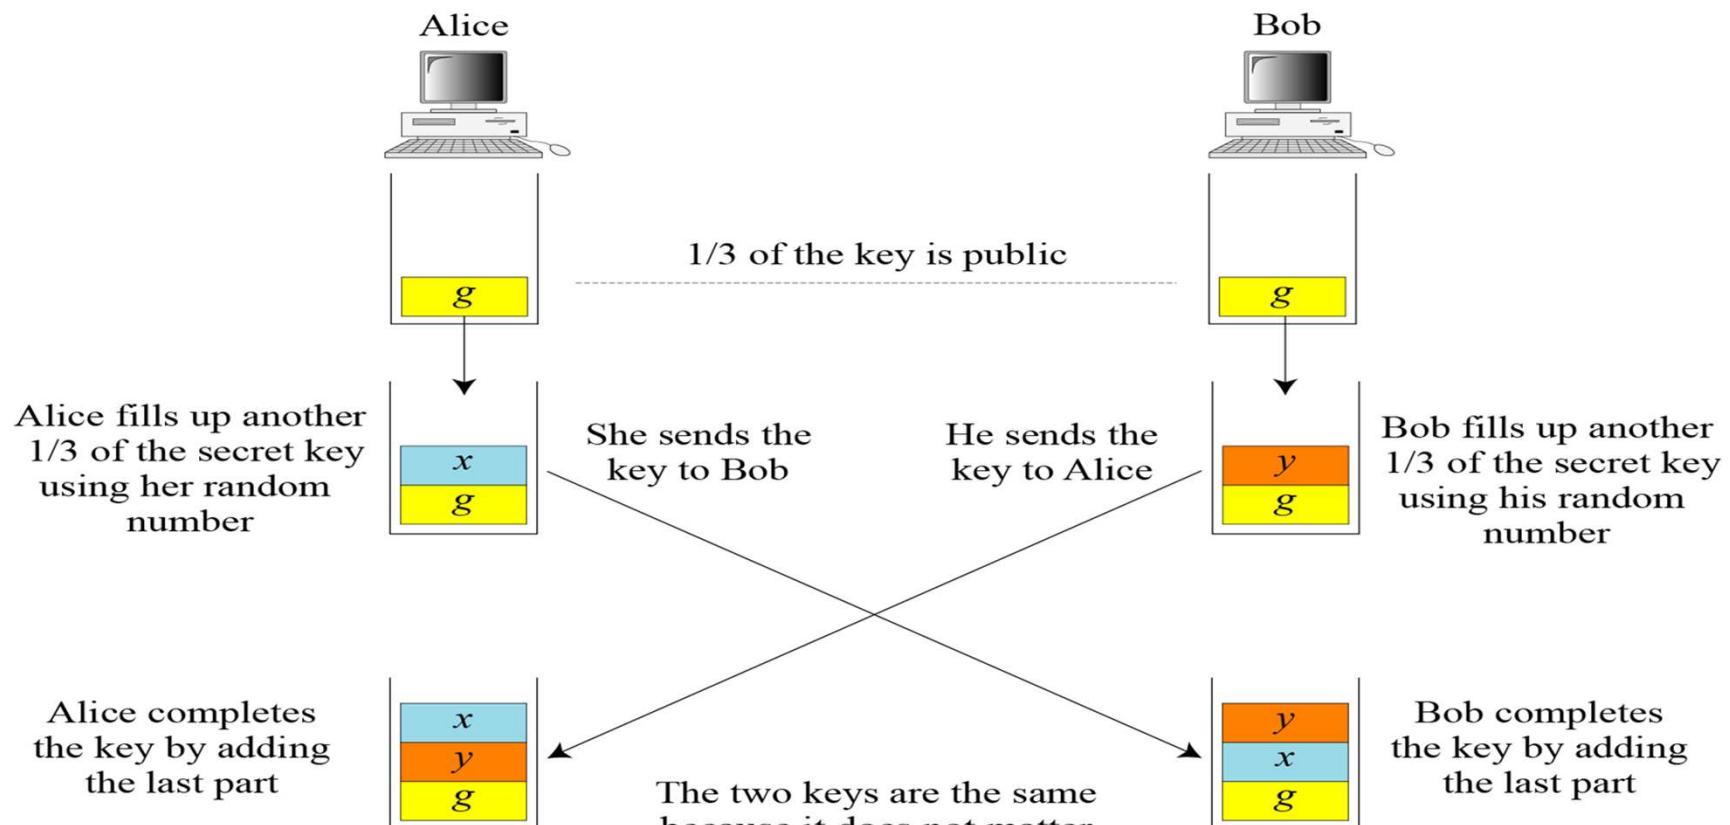

<i>p</i>	764624298563493572182493765955030507476338096726949748923573772860925 235666660755423637423309661180033338106194730130950414738700999178043 6548785807987581
<i>g</i>	2
<i>x</i>	557
<i>y</i>	273

Diffie-Hellman idea

Example:

Step 1: Alice and Bob get public numbers $P = 23$, $G = 9$

Step 2: Alice selected a private key $x = 4$ and Bob selected a private key $y = 3$

Step 3: Alice and Bob compute public values

Alice: $R_1 = ?$

Bob: $R_2 = ?$

Step 4: Alice and Bob exchange public numbers

Step 5: Alice receives public key R_2 and Bob receives public key R_1

Step 6: Alice and Bob compute symmetric keys

Alice: $k_a = ?$

Bob: $k_b = ?$

Step 7: What is the value of shared secret key $k??.$

Example:

Step 1: Alice and Bob get public numbers $P = 23$, $G = 9$

Step 2: Alice selected a private key $x = 4$ and Bob selected a private key $y = 3$

Step 3: Alice and Bob compute public values

$$\text{Alice: } R_1 = (9^4 \bmod 23) = (6561 \bmod 23) = 6$$

$$\text{Bob: } R_2 = (9^3 \bmod 23) = (729 \bmod 23) = 16$$

Step 4: Alice and Bob exchange public numbers

Step 5: Alice receives public key $R_2 = 16$ and Bob receives public key $R_1 = 6$

Step 6: Alice and Bob compute symmetric keys

$$\text{Alice: } k_a = R_2^a \bmod p = 65536 \bmod 23 = 9$$

$$\text{Bob: } k_b = R_1^b \bmod p = 216 \bmod 23 = 9$$

Step 7: $K=9$ is the shared secret.
